

AI-Enabled HR Transformation Project Portfolio

Operating Model | HR Process Redesign | People Systems
AI & Automation | Governance | Adoption | Benefits

HumanEvoX transformation focus

HumanEvoX applies HR domain expertise, AI, automation, analytics and people-system thinking to redesign HR work across the employee lifecycle. The focus is not technical configuration: it is current-state diagnosis, requirements, workflow and data rules, AI use-case design, controls, UAT, adoption and measurable operating outcomes.

Portfolio basis

This portfolio presents HumanEvoX transformation case designs across UAE and KSA client profiles. Client profiles are anonymised/archetypal unless explicitly identified as documented prior experience. Named platforms describe relevant design architectures and do not imply deployment at every client. Results are proposed outputs and performance measures unless stated otherwise.

Transformation logic

HR Business Problem -> People Data -> Process & Workflow Design -> AI / Technology -> Automation -> Analytics
-> Human Decision

A practical first engagement

Select one high-friction HR journey, baseline effort and quality, map the current process and data, prioritise AI/automation opportunities, design controls, run a bounded pilot and compare outcomes before scale-up.

01 AI-Enabled HR Operating Model & Enterprise Transformation Roadmap

Client industry / country

UAE Local Conglomerate - diversified portfolio across real estate, retail and services.

Client pain point / scope

Fragmented HR processes across business units, inconsistent ownership, manual approvals and isolated AI experiments make it difficult to scale transformation across the employee lifecycle.

Our methodology

Map current-state HR journeys, decision rights, data dependencies and effort. Prioritise use cases through value-feasibility-risk scoring. Redesign target workflows across HR operations, onboarding, recruitment, performance, talent and learning. Use an enterprise LLM to draft requirements, process variants and control questions; use process-mining evidence where available. Automate low-risk routing, reminders and approvals, then pilot in one business unit before scale-up.

Technology leveraged / design stack

Microsoft Copilot / approved enterprise LLM; Miro or Visio; SAP SuccessFactors / Oracle HCM as system-of-record examples; Power Automate; SharePoint; Power BI; process-mining option such as Celonis subject to access.

Results / performance measures

Transformation blueprint, prioritised AI/automation backlog, RACI, target-state process maps and 90-day pilot. Track cycle time, manual touches, rework, adoption, exception ageing and employee/manager effort.

Differentiation for client

Connects HR-domain redesign, AI use-case governance, workflow automation and measurable operating outcomes rather than treating AI as a standalone tool.

02 AI-Enabled Employee Service & HR Operations Transformation

Client industry / country

KSA Multinational - regional professional and business services organisation.

Client pain point / scope

High HR service volumes, repeated employee questions and email-based case handling create inconsistent responses, slow resolution and limited visibility into recurring demand.

Our methodology

Classify service demand by topic, risk and required authority. Build a governed HR knowledge layer from approved policies. Use retrieval-based AI to draft responses with source references; route sensitive or ambiguous cases to HR. Automate case intake, categorisation, SLA reminders and closure surveys. Analyse demand themes to remove root causes and improve policy/process design.

Technology leveraged / design stack

ServiceNow HRSD or Microsoft 365 service workflow; Microsoft Copilot / Azure OpenAI or approved LLM; SharePoint knowledge base; Power Automate; Power BI.

Results / performance measures

Pilot outputs: service taxonomy, knowledge governance, AI response workflow, escalation rules and dashboard. Measure first-contact resolution, response time, reopen rate, escalation rate, knowledge coverage and employee satisfaction.

Differentiation for client

Combines AI assistance with service governance and human escalation so automation increases consistency without bypassing HR accountability.

03 Government HR Transformation & AI Readiness Programme

Client industry / country

UAE Government Entity - large public-sector workforce.

Client pain point / scope

Multiple HR processes depend on manual forms, approvals and spreadsheet tracking. Leadership wants practical AI use cases but requires strong data, privacy, auditability and decision controls.

Our methodology

Run AI readiness across data quality, process maturity, technology, governance, literacy and use-case value. Map priority journeys and identify automation before generative AI. Define permitted AI tasks, restricted decisions and human approvals. Prototype selected use cases such as policy assistance, case summarisation, workforce reporting commentary and manager guidance. Establish UAT, risk testing and adoption plans before deployment.

Technology leveraged / design stack

Microsoft Copilot / Azure OpenAI in approved environment; Power Platform; SharePoint; Power BI; existing government HRIS/HCM; Microsoft Purview or equivalent governance controls where available.

Results / performance measures

Readiness assessment, use-case heatmap, governance model, pilot designs and adoption roadmap. Measure data completeness, process cycle time, AI correction rate, user adoption, exception volume and control compliance.

Differentiation for client

Public-sector transformation anchored in governance, evidence and controlled pilots rather than broad AI deployment without clear decision boundaries.

04 AI-Enabled Workforce & Talent Transformation for Banking

Client industry / country

UAE Bank - enterprise HR, talent and workforce planning environment.

Client pain point / scope

Workforce planning, talent reviews and succession discussions use disconnected spreadsheets and narrative inputs, making cross-business comparison slow and difficult to audit.

Our methodology

Standardise workforce and talent definitions, critical-role criteria and data ownership. Consolidate approved HRIS and talent data. Use analytics to identify movement, vacancy, succession and capability patterns; use an LLM only to draft commentary from validated aggregate measures. Automate review-pack assembly, action tracking and reminder workflows. Keep promotion, succession and workforce decisions with accountable leaders.

Technology leveraged / design stack

Workday / SAP SuccessFactors / Oracle HCM as possible source platforms; Excel and Power Query; Power BI / DAX; Microsoft Copilot; Power Automate; SharePoint.

Results / performance measures

Executive workforce pack, talent-review workflow, action tracker and governance controls. Track preparation time, data exceptions, action closure, succession coverage, critical-role exposure and internal movement.

Differentiation for client

Brings analytics, AI-assisted interpretation and workflow discipline into talent decisions while preserving leadership judgement and auditability.

05 People Systems, AI & Workflow Integration Blueprint

Client industry / country

UAE Local Technology Group - fast-growing multi-entity organisation.

Client pain point / scope

Rapid growth has produced duplicated employee data, overlapping tools and manual handoffs between HRIS, ATS, LMS, performance and analytics processes.

Our methodology

Create a system-and-data map covering ownership, authoritative fields, integrations and manual handoffs. Identify where API/integration work is required versus where workflow automation is sufficient. Use AI to support requirements analysis, data-rule documentation and test-case generation. Redesign joiner/mover/leaver and talent workflows; define UAT scenarios, exception handling and adoption responsibilities.

Technology leveraged / design stack

Darwinbox / SAP SuccessFactors / Oracle HCM examples; Teamtailor or enterprise ATS; LMS/talent platforms; Power Automate or Make for approved orchestration; Power BI; Postman/API documentation used by technical partners where relevant.

Results / performance measures

Target architecture, data ownership matrix, integration backlog, workflow designs, UAT pack and adoption plan. Measure duplicate data, failed handoffs, manual reconciliations, processing time and UAT defect closure.

Differentiation for client

HR-led systems transformation: HumanEvoX defines process, data rules, controls, UAT and adoption while technical configuration remains with authorised platform/integration teams.

06 AI-Enabled Performance & Talent Management Transformation

Client industry / country

KSA Government-Linked Organisation - national-scale services environment.

Client pain point / scope

Performance cycles are administratively heavy, objectives vary in quality and talent-review evidence is inconsistent across functions.

Our methodology

Redesign the performance cycle around clearer objectives, evidence and manager accountability. Use AI to suggest objective wording, summarise authorised evidence and prepare calibration prompts - never to determine ratings. Automate cycle reminders, completion tracking and exception escalation. Link validated performance and talent data to development and succession discussions with transparent criteria.

Technology leveraged / design stack

SAP SuccessFactors PMGM / Oracle HCM / Workday examples; Microsoft Copilot or approved LLM; Power Automate; Power BI; Microsoft Forms where needed.

Results / performance measures

Target process, AI guardrails, manager guidance, calibration pack and cycle dashboard. Track completion, overdue actions, objective quality checks, calibration changes, manager effort and employee feedback.

Differentiation for client

Uses AI to improve preparation and consistency while explicitly separating assistance from rating, promotion and succession decisions.

07 AI-Enabled Learning & Skills Transformation

Client industry / country

KSA Multinational - industrial and technical services workforce.

Client pain point / scope

Learning demand is driven by role changes and strategic capability priorities, but course catalogues and development plans are difficult to connect to skills evidence and business needs.

Our methodology

Define role/skill taxonomy and priority capability gaps. Use AI to classify existing learning assets, draft learning pathways and create role-specific development recommendations for review. Automate enrolment triggers, reminders and completion reporting where systems permit. Use analytics to compare participation, completion, assessment and application evidence; managers validate development priorities.

Technology leveraged / design stack

Enterprise LMS; SAP SuccessFactors Learning / Oracle Learning examples; Microsoft Copilot / approved LLM; Excel / Power Query; Power BI; Power Automate.

Results / performance measures

Skills map, curated pathways, governance rules and learning analytics dashboard. Track pathway coverage, completion, assessment evidence, time-to-proficiency proxies and manager validation.

Differentiation for client

Connects AI-assisted content and pathway design to skills governance and business capability evidence, rather than measuring learning only through attendance.

08 AI-Enabled Onboarding & Employee Journey Transformation

Client industry / country

UAE Aviation & Logistics Group - high-volume multi-role workforce.

Client pain point / scope

Onboarding involves multiple teams, documents and approvals; new joiners experience inconsistent communication and managers lack visibility into readiness before day one.

Our methodology

Map preboarding through first-90-day milestones and define ownership by event. Use AI to tailor approved communications and manager checklists by role/worker segment. Automate document reminders, task routing, equipment/access dependencies and milestone surveys. Use dashboards to surface overdue dependencies and recurring bottlenecks. Sensitive employment decisions remain outside the AI workflow.

Technology leveraged / design stack

Oracle HCM / SAP SuccessFactors Onboarding / Workday examples; Microsoft Copilot; Power Automate; SharePoint / Microsoft Lists; Power BI; Microsoft Forms.

Results / performance measures

Journey map, role-based checklist library, automated task flows and onboarding dashboard. Track day-one readiness, overdue dependencies, completion time, early queries and new-hire/manager experience.

Differentiation for client

Transforms onboarding as an end-to-end operational journey, combining system workflow, AI-assisted communication and cross-functional accountability.

09 HR AI Governance, Controls & Responsible Adoption Framework

Client industry / country

UAE Financial Services Organisation - regulated environment.

Client pain point / scope

Teams are experimenting with generative AI for HR tasks without consistent rules for data handling, approved use cases, validation, human review or model-output monitoring.

Our methodology

Inventory current and proposed AI use cases. Classify them by data sensitivity, decision impact and regulatory/employee risk. Define permitted inputs, prohibited uses, evidence requirements, human approvals and escalation. Build test cases for hallucination, bias, unsupported inference and privacy leakage. Maintain prompt/version logs and monitor corrections, exceptions and overrides.

Technology leveraged / design stack

Approved enterprise LLM / Microsoft Copilot; SharePoint policy and version control; Excel test cases; Power Automate approval routing; Power BI quality monitoring; enterprise security/governance tooling as applicable.

Results / performance measures

AI use-case register, risk tiering, control library, testing protocol and monitoring dashboard. Track correction rate, unsupported claims, exceptions, overrides, approval compliance and incident trends.

Differentiation for client

Operational governance embedded into HR workflows so responsible AI is testable, reviewable and measurable rather than a policy document alone.

10 Enterprise HR Transformation Benefits & Adoption Office

Client industry / country

UAE Real Estate & Hospitality Conglomerate - multi-business HR transformation programme.

Client pain point / scope

HR transformation initiatives launch across systems, analytics and automation, but benefits, adoption and dependencies are tracked inconsistently across workstreams.

Our methodology

Create a transformation office cadence linking use cases to owners, baseline measures, milestones, dependencies and realised benefits. Use AI to summarise validated workstream updates and surface unresolved actions; automation consolidates status inputs and reminders. Build adoption measures by persona and process. Require benefit owners to validate realised outcomes before executive reporting.

Technology leveraged / design stack

Microsoft Teams; SharePoint / Lists; Power Automate; Power BI; Microsoft Copilot; existing HRIS/HCM and project-management tools.

Results / performance measures

Portfolio dashboard, benefits register, adoption scorecard, RAID log and executive reporting cadence. Track milestone delivery, benefit validation, adoption, exception ageing, rework and decision turnaround.

Differentiation for client

Provides the governance layer that turns multiple HR technology and AI initiatives into one measurable transformation portfolio.
