

AI-Enabled Strategic Workforce Planning

Workforce Demand & Supply | Skills Intelligence | Scenario Modelling
Capacity | Workforce Cost | Talent Actions | AI Decision Support

HumanEvoX workforce planning focus

HumanEvoX applies People Analytics, workforce intelligence, AI and scenario modelling to translate business strategy into evidence-based workforce decisions. The portfolio connects workforce demand, current and future skills, internal supply, external talent intelligence, capacity, cost and talent actions.

Portfolio scope

Twelve UAE and KSA case designs span enterprise workforce demand, skills forecasting, nationalisation, giga-project mobilisation, technology talent, aviation/logistics capacity, healthcare workforce planning, industrial sourcing strategy, workforce cost/productivity, attrition-adjusted supply, internal mobility/reskilling and enterprise SWP governance.

Workforce planning methodology

Business Strategy -> Demand Drivers -> Workforce Baseline -> Skills / Capacity -> Scenario Modelling -> AI-Assisted Intelligence -> Supply & Gap Analysis -> Build / Buy / Borrow / Move / Automate -> Cost & Risk -> Human Executive Decision -> Continuous Monitoring

Responsible AI & scope boundary

AI is used for classification, assumption checking, summarisation, scenario commentary and decision preparation from approved data. It does not make individual employment decisions. HRIS/HCM platforms are treated as validated data sources; the portfolio does not claim technical implementation, configuration, data migration or systems integration.

01 Enterprise Workforce Demand & Capacity Planning

Client industry / country

UAE Local Conglomerate - diversified multi-business workforce.

Client pain point / scope

Business units plan headcount independently, with limited connection between strategic growth assumptions, productivity, workforce capacity and total workforce cost.

Our methodology

Translate business plans into workforce demand drivers by entity, function, role family and horizon. Establish a validated workforce baseline and productivity/capacity assumptions. Build base, growth and constrained scenarios. Use AI to summarise planning assumptions, identify inconsistent inputs and surface material scenario changes for analyst review. Automate planning submissions and exception alerts; leadership approves final workforce plans.

Technology leveraged / design environment

Excel scenario modelling; Power Query; Power BI / DAX; approved enterprise LLM / Microsoft Copilot; Power Automate; HRIS/HCM data as validated source input.

Results / performance measures

Workforce baseline, demand model, scenario dashboard and planning governance. Measure demand/supply gaps, capacity utilisation, workforce cost, vacancy exposure and plan variance.

Differentiation for client

Connects strategy, capacity, cost and workforce decisions rather than treating workforce planning as an annual headcount exercise.

02 AI-Enabled Skills Demand Forecasting

Client industry / country

UAE Bank - digital, data, risk and customer transformation agenda.

Client pain point / scope

Future business priorities require new digital and analytical skills, but existing job titles and historical headcount do not reveal the capabilities that will be needed.

Our methodology

Define strategic capabilities and a controlled skills taxonomy. Map roles to validated current skills and proficiency evidence. Use AI to classify approved job/role content and identify adjacent skills for analyst validation. Model future demand by strategic initiative and scenario; compare demand with internal supply. Prioritise reskill, hire, redeploy and partner actions with business leaders.

Technology leveraged / design environment

Power BI; Excel / Power Query; SQL/Python where appropriate; approved LLM / Microsoft Copilot; optional Eightfold AI or Gloat where already available; HR/talent data inputs.

Results / performance measures

Future-skills heatmap, role-skill demand scenarios and gap dashboard. Track critical skill gaps, internal coverage, reskilling pipeline, external dependency and time-to-capability.

Differentiation for client

Moves planning from job-count forecasting toward validated capability and skills intelligence while retaining human validation of AI-derived classifications.

03 Nationalisation & Strategic Workforce Scenario Planning

Client industry / country

KSA Government-Linked Organisation - large professional and operational workforce.

Client pain point / scope

Growth plans must balance workforce demand, critical capability, localisation objectives, talent availability and realistic development lead times.

Our methodology

Segment roles by business criticality, scarcity, localisation opportunity and development lead time. Establish current workforce supply and pipeline. Model multiple localisation and growth scenarios with explicit assumptions. Use AI to summarise role/skill evidence and external market intelligence for analyst review. Test Build, Buy, Borrow and Move options and identify capability risks. Leadership selects the preferred scenario.

Technology leveraged / design environment

Power BI / DAX; Excel scenario models; Power Query; approved LLM / Copilot; external talent intelligence; existing HRIS/talent data.

Results / performance measures

Localisation scenario dashboard, critical-role heatmap and action portfolio. Track localisation trajectory, critical-skill coverage, pipeline readiness, external hiring dependency and scenario risk.

Differentiation for client

Balances localisation with capability continuity and realistic talent supply rather than treating nationalisation as a standalone percentage target.

04 Giga-Project Workforce Ramp-Up & Mobilisation Planning

Client industry / country

KSA Government / Giga-Project Environment - multi-phase programme workforce.

Client pain point / scope

Workforce requirements change sharply by programme phase, while scarce specialist skills, mobilisation lead times and contractor dependencies create delivery risk.

Our methodology

Translate programme milestones into role-family demand by phase and location. Define mobilisation lead times, productivity assumptions and critical dependencies. Build scenario curves for delayed, accelerated and constrained delivery. Use AI to summarise changes in approved programme assumptions and flag affected workforce segments. Model Build, Buy, Borrow and partner capacity; create trigger points for workforce actions.

Technology leveraged / design environment

Excel / Power Query; Power BI; approved enterprise LLM; Power Automate for planning workflow; programme milestone inputs; validated workforce data.

Results / performance measures

Phase-based demand curve, mobilisation plan, trigger dashboard and scarcity heatmap. Track workforce readiness, critical vacancies, mobilisation lead time, contractor dependency and milestone exposure.

Differentiation for client

Links workforce decisions directly to programme phases and delivery triggers rather than static annual manpower plans.

05 AI Technology Workforce Planning & Skills Scarcity

Client industry / country

UAE Technology Group - AI, data, cloud and product workforce.

Client pain point / scope

Rapidly changing technology demand makes historical workforce plans obsolete, while emerging skill definitions and external scarcity complicate hiring assumptions.

Our methodology

Define strategic technology domains, role families and priority skills. Combine internal workforce/skills evidence with external talent intelligence. Use AI to classify role content, normalise skill terminology and draft adjacent-talent hypotheses for validation. Model demand under product/growth scenarios and test internal mobility, reskilling, hiring and partner options. Refresh scarcity assumptions periodically.

Technology leveraged / design environment

Power BI; SQL/Python where appropriate; approved LLM / Microsoft Copilot; external talent intelligence; optional Eightfold/Gloat; Excel scenario modelling.

Results / performance measures

Technology workforce map, skill-scarcity matrix and supply strategy dashboard. Track skill coverage, internal mobility potential, hiring feasibility, time-to-fill risk and external market concentration.

Differentiation for client

Combines workforce planning with talent intelligence so demand scenarios are tested against actual talent-market feasibility.

06 Aviation & Logistics Workforce Capacity Forecasting

Client industry / country

UAE Aviation & Logistics Group - operational and corporate workforce.

Client pain point / scope

Volume changes, seasonality, service standards and shift requirements create variable workforce demand that cannot be managed through fixed headcount targets.

Our methodology

Identify operational demand drivers such as volumes, schedules, service ratios and productivity. Establish workforce availability and capacity assumptions. Model peak, base and disruption scenarios by workforce segment. Use analytics to compare demand, available capacity, overtime/contingent options and service risk. Use AI to draft scenario commentary from validated metrics; operations and HR approve actions.

Technology leveraged / design environment

Power BI / DAX; Excel forecasting; Power Query; SQL/Python where appropriate; approved LLM; operational planning data plus validated workforce data.

Results / performance measures

Capacity model, seasonal forecast and exception dashboard. Track required FTE, capacity gap, overtime exposure, contingent dependency, productivity and service-risk thresholds.

Differentiation for client

Integrates operational demand with workforce capacity rather than forecasting headcount independently of business volumes.

07 Healthcare Workforce Capacity & Critical Skills Planning

Client industry / country

UAE Healthcare Network - clinical and non-clinical workforce.

Client pain point / scope

Service expansion and patient-demand changes require forward visibility of critical workforce capacity, specialist scarcity and long development/recruitment lead times.

Our methodology

Segment workforce by service line, role criticality, qualification constraints and lead time. Translate approved service-demand assumptions into workforce capacity requirements. Model attrition, recruitment pipeline and development supply. Use AI to organise approved role/skill information and summarise scenario gaps for analyst review. Build mitigation options across hiring, development, scheduling and contingent capacity.

Technology leveraged / design environment

Power BI; Excel / Power Query; SQL/Python where appropriate; approved enterprise LLM; workforce and service-demand data sources.

Results / performance measures

Critical workforce forecast, supply pipeline and risk dashboard. Track capacity gap, vacancy exposure, pipeline conversion, lead time, contingent reliance and service expansion readiness.

Differentiation for client

Adds skill criticality and supply lead time to capacity planning so workforce risk is visible before it becomes a service-delivery constraint.

08 Industrial Workforce Build-Buy-Borrow-Automate Strategy

Client industry / country

KSA Industrial Multinational - operations, engineering and corporate functions.

Client pain point / scope

Transformation and productivity programmes change workforce requirements while some skills remain scarce, expensive or unsuitable for permanent hiring.

Our methodology

Establish current role/skill supply and future demand by transformation initiative. Identify work that can be redesigned or automated before assuming additional hiring. Compare Build, Buy, Borrow, Move and Automate options using time, cost, scarcity and business-risk criteria. Use AI to summarise approved role/process evidence and draft scenario comparisons for review. Leaders approve sourcing strategy.

Technology leveraged / design environment

Excel scenario modelling; Power BI; Power Query; approved LLM / Copilot; process/workforce data; external talent intelligence.

Results / performance measures

Workforce sourcing strategy, option matrix and scenario dashboard. Track workforce cost, time-to-capability, scarce-skill exposure, internal fill, contingent reliance and automation opportunity.

Differentiation for client

Treats automation as one workforce option alongside talent actions, avoiding the assumption that every capability gap requires external recruitment.

09 Workforce Cost, Productivity & Organisation Scenario Modelling

Client industry / country

UAE Financial Services Organisation - regulated professional workforce.

Client pain point / scope

Leadership needs to understand how growth, productivity, spans/layers and workforce mix affect cost without reducing workforce planning to blanket cost cutting.

Our methodology

Build a validated baseline for workforce cost, role mix, management layers and selected productivity measures. Define business-led scenarios for growth, role redesign and workforce mix. Use AI only to summarise validated scenario outputs and assumptions. Compare financial and capability implications, identify risks and require business/HR review before action. Avoid automated individual-level recommendations.

Technology leveraged / design environment

Power BI / DAX; Excel scenario modelling; Power Query; approved LLM / Copilot; finance and validated workforce data.

Results / performance measures

Scenario model, workforce-cost bridge and organisation dashboard. Track cost/FTE, workforce mix, spans/layers, productivity indicators, capability risk and scenario variance.

Differentiation for client

Combines financial discipline with capability and organisation risk rather than treating workforce optimisation as indiscriminate headcount reduction.

10 Attrition-Adjusted Workforce Supply Planning

Client industry / country

UAE Multinational - regional headquarters and specialist functions.

Client pain point / scope

Workforce plans assume current employees remain available, but attrition, internal movement and long hiring lead times can create hidden future supply gaps.

Our methodology

Build a workforce supply baseline by critical segment. Model historical movement and approved attrition scenarios at aggregate level; do not score individuals for exit risk. Add recruitment pipeline, internal mobility and development lead times. Use AI to summarise validated movement patterns and scenario impacts for analyst review. Define trigger thresholds for hiring, succession or development actions.

Technology leveraged / design environment

Power BI; Excel / Power Query; SQL/Python where appropriate; approved enterprise LLM; ATS/talent/HR data as validated inputs.

Results / performance measures

Supply forecast, movement dashboard and trigger framework. Track projected supply gap, aggregate attrition, internal movement, pipeline coverage, time-to-fill and critical-role exposure.

Differentiation for client

Uses aggregate workforce movement for planning without turning predictive analytics into individual employee-risk labelling.

11 Workforce Planning for Internal Mobility & Reskilling

Client industry / country

UAE Government Entity - digital transformation and capability renewal.

Client pain point / scope

Business transformation creates declining demand in some activities and new demand elsewhere, but workforce planning is disconnected from internal mobility and reskilling decisions.

Our methodology

Map changing work and role-family demand under target-state scenarios. Establish validated transferable skills and adjacent-role pathways. Use AI to classify approved role/skill content and propose adjacency hypotheses for human validation. Quantify potential internal supply, reskilling time and residual hiring need. Prioritise mobility/reskilling cohorts at aggregate role level, with individuals opting into assessed pathways.

Technology leveraged / design environment

Power BI; Excel / Power Query; approved LLM / Copilot; optional skills marketplace tools such as Gloat/Eightfold where available; LMS/talent data inputs.

Results / performance measures

Mobility opportunity map, reskilling pathways and workforce-gap dashboard. Track internal supply potential, pathway participation, skill attainment, redeployment and residual external hiring demand.

Differentiation for client

Turns workforce planning into a talent-action engine while avoiding automated employee selection or forced redeployment.

12 Enterprise Workforce Planning Operating Model & AI Planning Copilot

Client industry / country

KSA Large Conglomerate - multiple businesses with decentralised workforce planning.

Client pain point / scope

Workforce plans use inconsistent definitions, assumptions and templates, making enterprise consolidation slow and reducing confidence in executive decisions.

Our methodology

Define planning calendar, governance, roles, common workforce taxonomy, scenario standards and approval thresholds. Establish certified baseline metrics and assumption templates. Design an AI planning copilot that checks submissions for missing assumptions, summarises scenario changes and drafts consolidated commentary from validated inputs. Automate submission reminders and exception routing. Central HR validates outputs before executive review.

Technology leveraged / design environment

Power BI; Excel / Power Query; Microsoft Copilot / approved enterprise LLM; Power Automate; SharePoint / Lists; validated HRIS/finance inputs.

Results / performance measures

SWP operating model, common planning pack, copilot workflow and executive dashboard. Track submission quality, cycle time, assumption completeness, plan variance, exception closure and decision follow-through.

Differentiation for client

Creates a repeatable enterprise workforce-planning capability with AI supporting planning discipline, not replacing accountable business judgement.
